

Solution routes for every map

200 maps | 341 verified routes | 200 without repairs and 141 with a purchased repair

What is stored: one shortest legal completion route for each map, and one shortest route after its existing repair is purchased. Completion means lighting the required number of houses and returning to the depot; it does not necessarily require every house. These are valid reference solutions, not all possible ways of winning.

How to read a route page: numbered tiles and arrows show movement order. S marks the starting depot. A plus sign means the tile is visited more than once; use the move table for every visit. In the table, each entry is **move number / column,row / light remaining**. Coordinates start at 1. Move 0 is the starting state.

Colors: gray = rubble; blue = depot; gold = house; violet outline = patrol loop; green = switch; purple = gate; brown = fading crossing; cyan = ice; dark blue = dark street. Yellow move entries mark a newly lit house. Green entries mark the finish. For an open-road repair the upgraded tile has a green outline.

State-aware hints: a stored starting route is not sufficient after the player has moved differently. The solver calculates a new route from their actual position, remaining light, lit houses, patrol phases, Echo trail, crossing timers and purchased terrain. If there is no solution from that state, the hint must report it instead of pretending the starting route still works.

Versioning: the companion JSON stores map fingerprints, a rules fingerprint, each ordered tile and its light/shadow/timer state. Regenerate and validate this archive when a map or rule changes. Planned gems, tunnel tokens and repair-required maps are not yet in these layouts; those changes will require new archives and action-aware routes.
